3C05: Risk Management

© Wolfgang Emmerich & Anthony Finkelstein

Unit 3: Risk Management

Objectives

- To explain the concept of *risk* & to develop its role within the software development process
- To introduce the use of risk management as a means of identifying & controlling risk in software development

© Wolfgang Emmerich & Anthony Finkelstein

It is **not** just a game!

© Wolfgang Emmerich & Anthony Finkelstein

2

Definitions of risk

- "The possibility of suffering harm or loss; danger"
- "The possibility of loss or injury"
- "Chance of danger, injury, loss"
- "A measure of the probability & severity of adverse effects"

Something bad happening

© Wolfgang Emmerich & Anthony Finkelstein

Risks in the everyday world

- Financial risks "your house is at risk if you fail to repay your mortgage or any loans secured on it"
- Health risks "the chance that a person will encounter a specified adverse health outcome (like die or become disabled)"
- Environmental & ecological risks "the likelihood of extinction due to exposure of terrestrial wildlife to contaminants"
- Security risks "there is a significant risk that widespread insertion of government-access key recovery systems into the information infrastructure will exacerbate, not alleviate, the potential for crime and information terrorism"

More examples?

© Wolfgang Emmerich & Anthony Finkelstein

5

How is risk dealt with?

- Basic process: identify the risk -> analyse its implications -> determine treatment methods -> monitor performance of treatment methods
- Techniques & heuristics for the identification, analysis, treatment & monitoring of risk

Insurance companies depend on understanding risk

 Risk management is a project management tool to assess & mitigate events that might adversely impact a project, thereby increasing the likelihood of success

© Wolfgang Emmerich & Anthony Finkelstein

Why is the software world interested in risk?

- Many post-mortems of software project disasters indicate that problems would have been avoided (or strongly reduced) if there had been an explicit early concern with identifying & resolving high-risk elements!
- An obvious cost factor!

Sources of software risk (systems context)

Reproduced from [Higuera 1996] "Software Risk Management", Technical Report CMU/SEI-96-TR-012, ESC-TR-96-012, June 1996

© Wolfgang Emmerich & Anthony Finkelstein

Why is it often forgotten?

- Optimistic enthusiasm at the start of projects
- Software process can lead to over-commitment & binding requirements much too early on
- Premature coding
- The "add-on" syndrome
- · Warning signals are missed

- · Legal implications
- Poor software risk management by project managers

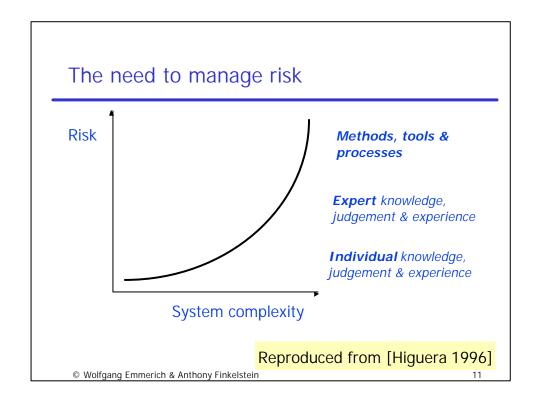

© Wolfgang Emmerich & Anthony Finkelstein

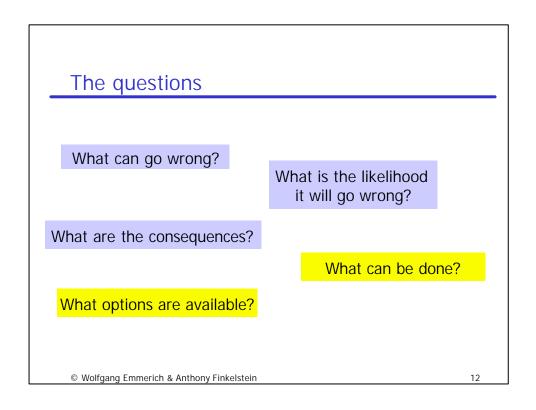

9

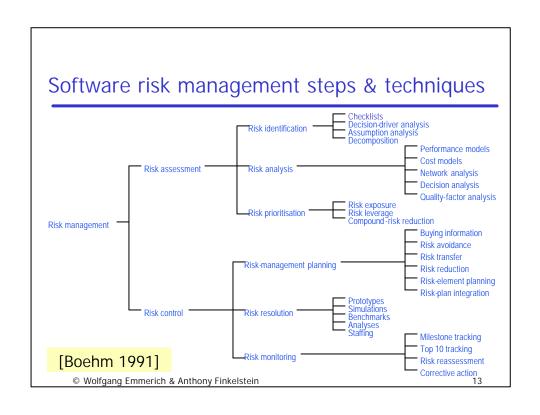

Software risk management

- Objectives
 - To identify, address & eliminate risk items before they become either threats to successful software operation or major sources of software rework
 - Necessary that some form of measurement is undertaken to determine & classify the range of risks a software development project faces, & to identify areas where a *significant* exposure exists
- The discipline attempts to provide a set of principles & practices to achieve the above
- A response to change & uncertainty

© Wolfgang Emmerich & Anthony Finkelstein

Risk assessment

 Risk identification - listing project-specific risk items that are likely to compromise a project's success

 Risk analysis - assessing the loss probability & loss magnitude for each identified risk item, & assessing compound risks

 Risk prioritisation - ordering & ranking the risk items identified & analysed

© Wolfgang Emmerich & Anthony Finkelstein

Risk control

 Risk-management planning - doing the ground work so as to be in a position to address each risk item

 Risk resolution - producing a situation in which risk items are eliminated or resolved

 Risk monitoring - tracking the project's progress towards resolving risk items & taking corrective action where required

© Wolfgang Emmerich & Anthony Finkelstein

15

E.g. top 10 risks in software project mgmt

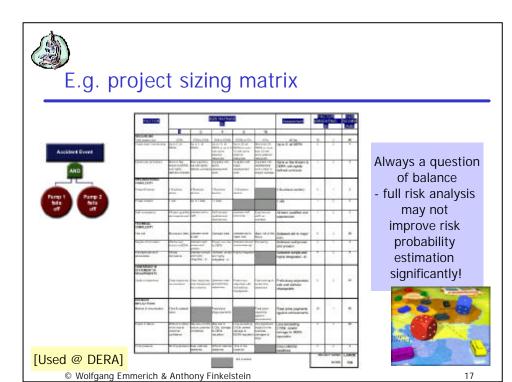

1. Personnel shortfalls

[Boehm 1991]

- 2. Unrealistic schedules & budgets
- 3. Developing the wrong functions & properties
- 4. Developing the wrong user interface
- 5. Gold-plating
- 6. Continuing stream of requirements changes
- 7. Shortfalls in externally furnished components
- 8. Shortfalls in externally performed tasks
- 9. Real-time performance shortfalls
- 10. Straining computer-science capabilities

Determine a risk-management technique to deal with each of these

© Wolfgang Emmerich & Anthony Finkelstein

E.g. prioritisation scheme

- Risk-exposure quantity is an effective technique for risk prioritisation
 - Assess risk probabilities & losses on a scale 0-10
 - Multiply probability by loss to determine exposure

Unsatisfactory outcome	Probability of unsatisfactory	unsatisfactory	Risk exposure	
	outcome	outcome		
Software error loses key data	3-5	8	24-40	
Processor memory insufficient	1	7	7	

 Relies on accurate estimates of the probability & loss associated with an unsatisfactory outcome

© Wolfgang Emmerich & Anthony Finkelstein

E.g. risk management plan

- The Risk Management Plan (RMP) presents the process for implementing *proactive* risk management as part of overall project management
- The RMP describes techniques for identifying, analysing, prioritising & tracking risks; developing risk-handling methods; & planning for adequate resources to handle each risk, should they occur
- The RMP also assigns specific risk management responsibilities & describes the documenting, monitoring & reporting processes to be followed

© Wolfgang Emmerich & Anthony Finkelstein

19

E.g. PMP summarised as a risk register

aspect.

Ways of dealing with risks

- Elimination: where exposure to risk is terminated
- **Retention:** where the risk is made tolerable, perhaps after some modification
- Avoidance: where the risk is negated in some way, possibly by redesign of work methods
- **Transfer:** where the risk is passed to a third party, either contractually or via insurance
- Need to balance acceptable risks

© Wolfgang Emmerich & Anthony Finkelstein

1

Implement & track

- An on-going process of measuring the effect that implementation of a risk management programme has had & its ability to continue
- Focus on the high-risk, high-leverage critical success factors
 - Rank a project's most significant risk items (prepare)
 - Establish a regular schedule for review of progress (meet)
 - Summarise progress on top risk items (discuss)
 - Focus on handling any problems in resolving the risk items (act)

© Wolfgang Emmerich & Anthony Finkelstein

Putting risk management into practice

- Insert risk management principles & practices into your software development process, so they are riskoriented & risk-driven - do this gradually & incrementally
- Start with a top 10 risk-item tracking process lightweight, cheap & good returns!
- Develop a WWWWWHHM RMP template to populate
- Not a prescription relies on good human judgement!

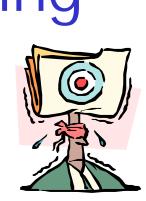

A focus on CSFs can help you win work!

© Wolfgang Emmerich & Anthony Finkeistein

23

The BIGGEST risk?

Not knowing what the risks are!

© Wolfgang Emmerich & Anthony Finkelstein

Key points

- The enemy of the software manger is risk
- Software projects must manage risks to minimise their consequences
- Time spent identifying, analysing & managing risk pays off!
- You can use the 6 stage conceptual framework with its associated techniques as a solid starting point
- If nothing else, be risk aware...

© Wolfgang Emmerich & Anthony Finkelstein
